

New stopper for CWF slide-in system

Stopper CWF slide-in system

In future, the PV modules will be fixed in our slide-in system by means of a newly developed component, the "stopper".

The stopper will replace the previously known clamping of the PV modules in the slide-in module support with the slip-off protection.

The background to this new development is the adaptation of our systems to the continuous changes in module frames by many module manufacturers. More and more module manufacturers are optimising their products to the effect that further fastening with the previously known anti-slip device is partly no longer possible.

The stopper fulfils the functionality of an anti-slip device and provides the flexibility we need to continue to guarantee our customers the quality they have come to expect from CWF products.
